

USER FLOW

The **User Flow** of the **Book Store Management System** describes the sequence of steps a user follows while browsing and purchasing books through the application.

Start

The process begins when the user opens the **Book Store application** to explore the collection of books available on the platform.

View Books

The user first views the list of books displayed on the platform. The application shows available books along with details such as title, author, genre, and price.

Search Books

The user can search for specific books using keywords such as book title, author name, or category. This helps users quickly find the books they are interested in.

Select Genre

The user can filter books by selecting a specific genre or category such as fiction, non-fiction, science, romance, education, or children's books.

Select Book

After filtering or searching, the user selects a book to view more details. The system displays complete information about the selected book, such as title, author, description, price, and availability.

Add to Cart

If the user wants to purchase the selected book, it is added to the shopping cart. The user can continue browsing more books or proceed with the purchase process.

Order Book

The user reviews the cart, confirms the selected books, and places the order. The system processes the purchase and stores the order details in the database.

View Orders

After placing the order, the user can view current and previous orders. This section helps the user track purchase history and order details.

End

The flow ends after the user completes the intended action, such as browsing books, placing an order, or viewing previous orders.
